

Exercise 4.6: Simple initContainer

1. As we have already learned about creating pods, this exercise does not include the particular steps. You can use this to determine if you need to review previous content. Use the following YAML, which is also in the course tarball, to create a pod with an initContainer. It will fail, view what it looks like and investigate the errors. Change the command from **/bin/false** to a successful command such as **/bin/true** and create the pod again.

YAML**init-tester.yaml**

```
1  apiVersion: v1
2  kind: Pod
3  metadata:
4    name: init-tester
5    labels:
6      app: inittest
7  spec:
8    containers:
9      - name: webservice
10        image: nginx
11    initContainers:
12      - name: failed
13        image: busybox
14        command: [/bin/false]
```
